Setting Hyperlinks

Adding clickable links to \LaTeX documents is easy with the `hyperref` package. You only need to include it in your preamble:
`\usepackage{hyperref}` After including the package, you can add links to your document using the `\href` command.

Adding Links

To add a link with a description (making a word clickable), use the `\href` command:

This is my link: `\href{http://www.github.com/techgrouppam}{Git`

This will create a clickable link in your document.

Embedding Bare URLs

If you want to embed a bare URL without an additional description, use the `\url` command:

You can also link to bare URLs: `\url{http://www.github.com/te...`

This will display the URL as a clickable link.

Adding Email Addresses

To add your email address as a clickable link, use the `\href` command with the `mailto` protocol:

My email address is:

```
\href{mailto:techgrouppam@gmail.com}{techgrouppam@gmail.com}
```

Clicking on the email address will open the reader's email program.
